APPOINTMENT MANAGEMENT APPLICATION

System Requirements Specification

1 PROJECT ABSTRACT

The **Appointment Management Application** is a Entity Framework 4.8 with MS SQL Server database connectivity. It enables to manage various aspects of appointment management.

Following is the requirement specifications:

	Appointment Management Application	
Modules		
	1	Appointment
Appointment Module Functionalities		
	1	Create an Appointment
	2	Update the existing Appointment details
	3	Get the Appointment by Id
	4	Get all Appointments
	5	Delete an Appointment

2 ASSUMPTIONS, DEPENDENCIES, RISKS / CONSTRAINTS

2.1 Appointment CONSTRAINTS

- When fetching an Appointment by ID, if the Appointment ID does not exist, the operation should throw a custom exception.
- When updating an Appointment, if the Appointment ID does not exist, the operation should throw a custom exception.
- When removing an Appointment, if the Appointment ID does not exist, the operation should throw a custom exception.

Common Constraints

- For all rest endpoints receiving @RequestBody, validation check must be done and must throw custom exception if data is invalid
- All the database operations must be implemented on entity object only
- Do not change, add, remove any existing methods in service layer
- In Repository interfaces, custom methods can be added as per requirements.
- All RestEndpoint methods and Exception Handlers must return data wrapped in **ResponseEntity**

3 BUSINESS VALIDATIONS

- Appointment Id (Int) Key, Not Null
- Title (string) , Not Null
- StartDateTime (Date), Not Null
- EndDateTime (Date), Not Null
- Location (string) , Not Null
- Description (string), Not Null
- User Id (Int), Not Null

4 REST ENDPOINTS

Rest End-points to be exposed in the controller along with method details for the same to be created

4.1 AppointmentCONTROLLER

URL Exposed		Purpose
1. /api/Appointment/GetAllAppointments		Fetches all the Appointments
Http Method	GET	
Parameter	-	
Return	<IEnumerable<Appointment>>	
2. api/Appointment/CreateAppointment		Add a new Appointment
Http Method	POST	
Parameter 1	Appointment	
Return	Appointment	
3. /api/Appointment/DeleteAppointment		Delete Appointment with given Appointment id
Http Method	DELETE	
Parameter 1	Int (id)	
Return	-	
4./ api/Appointment/GetAppointmentById		Fetches the Appointment with the given id
Http Method	GET	
Parameter 1	Int (id)	
Return	Appointment	
5. /api/Appointment/UpdateAppointment		Updates existing Appointment
Http Method	PUT	
Parameter 1	Int (id)	
Parameter 2	Appointment	
Return	Appointment	

5. TEMPLATE CODE STRUCTURE

5.1 Package: AppointmentManagementApp

Resources

Names	Resource	Remarks	Status
Package Structure			
controller	Appointment Controller	Controller class to expose all rest-endpoints for auction related activities.	Partially implemented
Web.Config	Web.Config file	Contain all Services settings and SQL server Configuration.	Already Implemented

Interface	IAppointmentService, interface	Inside all these interface files contains all business validation logic functions.	Already Implemented
Service	AppointmentService CS file	Using this all class we are calling the Repository method and use it in the program and on the controller.	Partially Implemented
Repository	IAppointmentRepository AppointmentRepository CS file and interface.	All these interfaces and class files contain all CRUD operation code for the database. Need to provide implementation for service related functionalities	Partially Implemented
Models	Appointment cs file	All Entities/Domain attribute are used for pass the data in controller.	Already Implementation

5.2 Package: AppointmentManagementApp.Tests

Resources

The AppointmentManagementApp.Tests project contains all test case classes and functions for code evaluation. Don't edit or change anything inside this project.

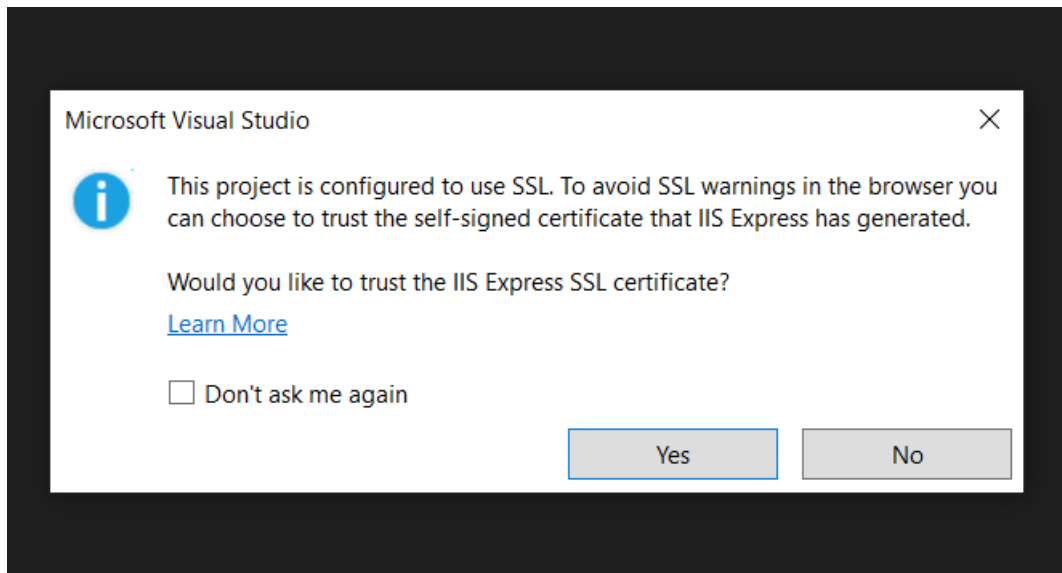

6. EXECUTION STEPS TO FOLLOW

1. After successfully cloning the project template on desktop, you will be able to see folder named with your user id. (e.g. user@gmail.com)
2. Go to below path and open solution file with Visual Studio.
Path: `user@gmail.com > AppointmentManagementApp > AppointmentManagementApp.sln`
3. All actions such as building, compiling, running the application, and executing test cases will be performed using the Visual Studio interface. Rather than using the command terminal, the necessary operations will be initiated through the buttons, menus, and features available within the Visual Studio IDE.

4. Press **Ctrl + S** to save your code.
5. Steps to Apply Migration(Code first approach):
 - Go to "Tools" -> "NuGet Package Manager" -> "Package Manager Console" from the top menu bar of Visual Studio.
 - After clicking on "Package Manager Console," a new tab should open at the bottom of the Visual Studio window, displaying the Package Manager Console.
 - Run following command to apply migration : `update-database`
6. Steps after applying migration :
 - Click on "Build"(Top Menu Bar) > "Clean Solution"
 - Click on "Build"(Top Menu Bar) > "Rebuild Solution"
 - Click on "Build" (Top Menu Bar) > "Build Solution"
7. To build your project in Visual Studio, click on "Build" in the top menu, then select "Build Solution" or press **Ctrl + Shift + B**.
8. To launch your application, press **F5** or use **Ctrl + F5** to start your application without debugging.

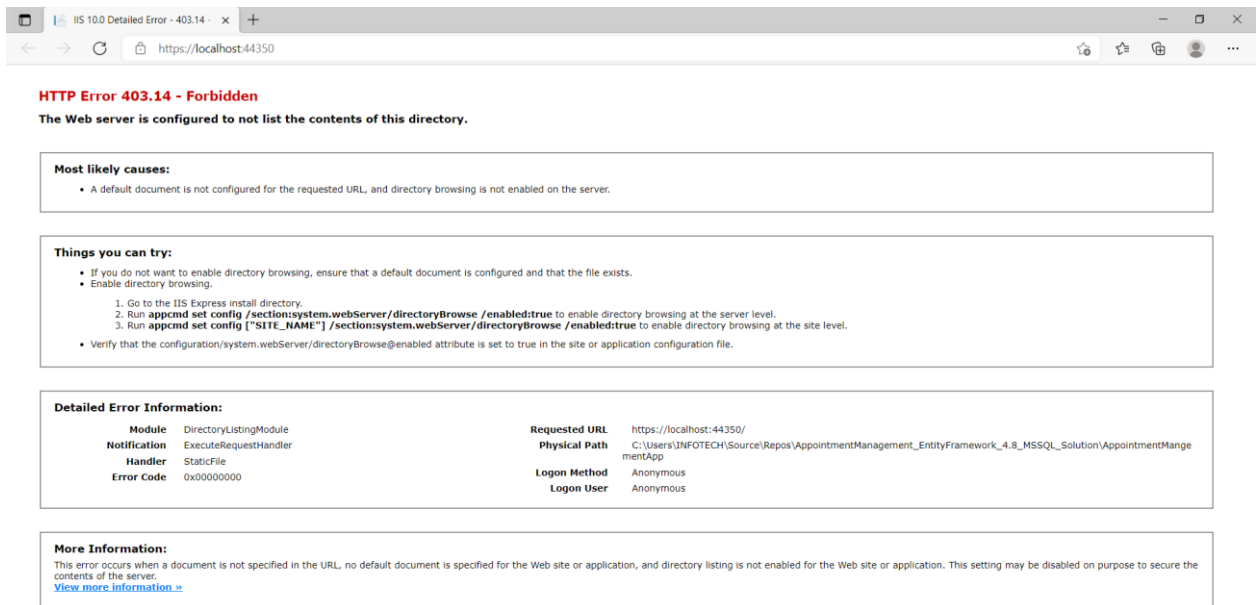

(Note: If you get below screens regarding SSL certificate, Click on YES for both screens.)

Note: The application will run in the local browser, Run Application again.

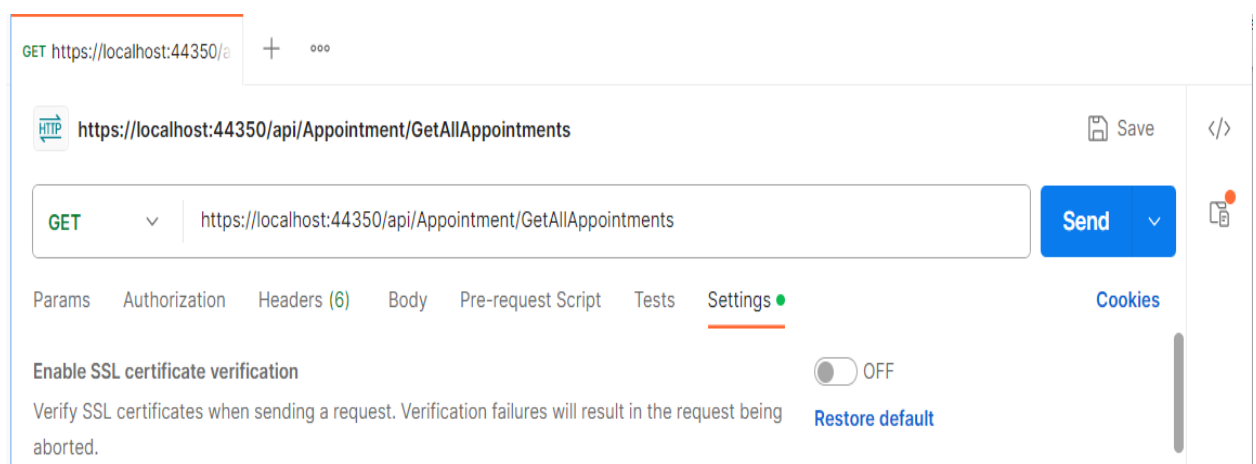

9. To test any applications on a browser, use the internal browser in the workspace.

(Note: This screen shows that your application is running on local browser, and the base URL is <https://localhost:44350>)

10. To test any Restful application, you can use POSTMAN.

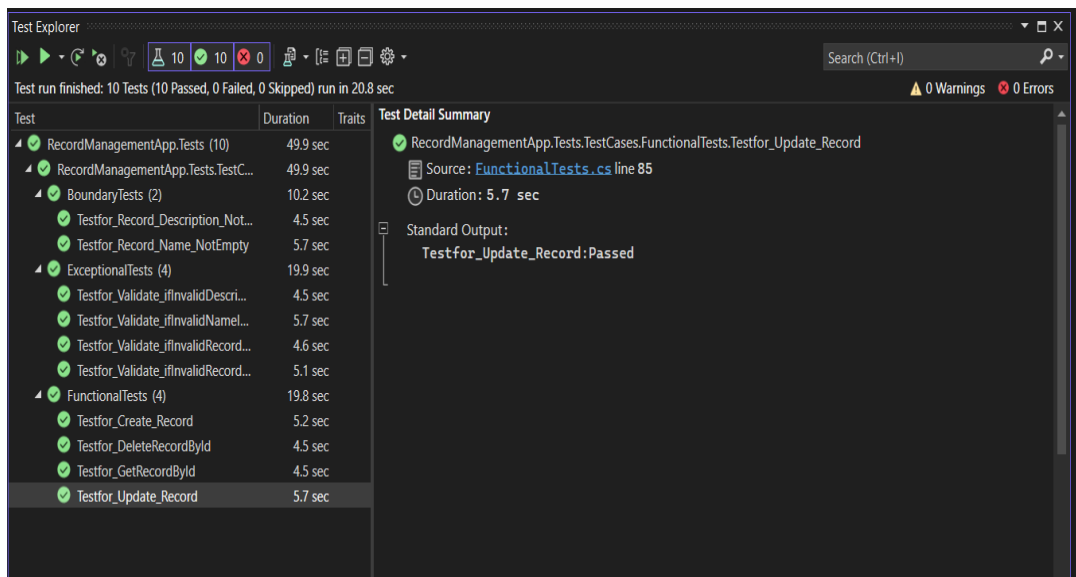

(Note: Before sending the request from postman you need to disable “Enable SSL certificate verification” from settings.)

Use same base URL link from local browser to test on postman.

11. To run test cases in your project in Visual Studio, click on "Test" -> “Run All Tests” in the top

menu. (You can run this command multiple times to identify the test case status, and refactor code to make maximum test cases passed before final submission).

12. Steps to push changes to GitHub:

- Go to "View" -> "Git Changes" from the top menu bar of Visual Studio.
- In the "Changes" window on the right side of Visual Studio, you'll see the modified files.
- Enter any commit message in the "Message" box at the top of the window, and click on "Commit All" button.
- After committing your changes, Click the "Push" button (Up Arrow Button) to push your committed changes to the GitHub repository.

13. If you want to exit (logout) and continue the coding later anytime (using Save & Exit option on Assessment Landing Page) then you need to follow step-12 compulsorily. This will push or save the updated contents in the internal git/repository. Else the code will not be available in the next login.

14. These are time bound assessments the timer would stop if you logout and while logging in back using the same credentials the timer would resume from the same time it was stopped from the previous logout.

15. You need to follow step-12 compulsorily, before final submission as well. This will push or save the updated contents in the internal git/repository, and will be used to evaluate the code quality.
